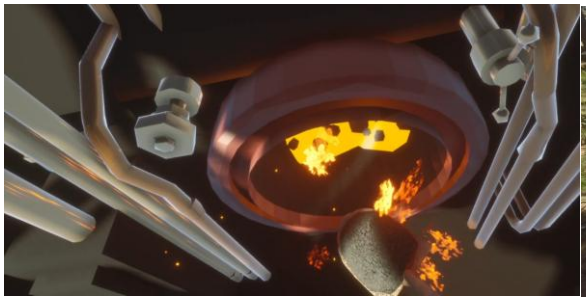
Report 1
TRAINDRAIN

Team 08: Volodymyr Zaikin, Aleksandr Zhidkov



Current status

Game design

TrainDrain is a game where the main goal is to drive the train as far as possible and not let the monsters destroy it. The player can move between two positions in the game: the roof of the wagon and the driver´s cabin.

- Basic gameplay is designed: the player rides on a train and throws coal into the furnace to keep the train moving and to make it faster.
- The player can switch between the roof of the wagon and the driver´s cabin.
- On the roof the player sees monsters that are chasing the train and can shoot them.
- These monsters (ghast like enemies) spawn around the train and try to damage it.
- In the cabin there is a box with coal, a shovel and the furnace where the player throws coal.
- If the furnace overheats, the durability of the train should go down.

- The run ends when the monsters destroy the train.

Programming part

- Train movement is implemented. The speed depends on how much coal the player puts into the furnace.
- Coal picking and throwing into the furnace is implemented.
- Spawning of monsters that chase the train is implemented.
- Shooting system for the first weapon is implemented so the player can kill the monsters.
- Switching between the two player positions (roof and cabin) is implemented.

Graphics part

- First train model with cabin and interior is created.
- Forest location is prepared: terrain, trees, rocks and other environment details.
- Rails for the train are placed in the scene.
- Furnace with fire effects and basic lighting inside the cabin is created.
- A placeholder 3D model for the gun in the player´s hand is added.

Plans for the near future

Game design

- Add more weapons based on real life pistols and other firearms.
- Design a simple repair system for the wagon and the train.
- Balance the game so that the player has to juggle three actions: throwing coal, shooting monsters and repairing the train.

Programming part

- Implement wagon damage and destruction system.
- Implement mechanics for repairing the wagon and restoring its durability.
- Improve monster spawning logic and their behavior around the train.
- Fix current bugs in movement, shooting and interactions.

Graphics part

- Create an additional wagon model that the player will have to repair.
- Improve weapon models and replace placeholder assets with models based on real objects.

Time allocation

- Volodymyr Zaikin total 5 hours
- Aleksandr Zhidkov total 5 hours
